EXPERIENCE

Vecin2Vecin

2025 — Present

Founder / Full-Stack Developer

Built and launched a neighbor-to-neighbor grocery delivery platform — a P2P marketplace where customers order groceries and nearby couriers fulfill deliveries within a defined service area.

- End-to-end product — landing page, phone/SMS auth, onboarding, catalog, basket & checkout, order tracking, courier take-order flow, in-app chat, push notifications, and account settings.
- Payments — multi-provider architecture with card and cash checkout, webhooks/callbacks, courier payout card binding, and Stripe for international payouts where applicable.
- Maps & geo — delivery area picker, address editor, order maps with region-aware tiles, geocoding, and geo-based currency / visitor country detection.
- Backend API — NestJS REST API with JWT auth, MongoDB, order batching, courier payouts, basket, regional catalog, MinIO for file uploads.
- Localization — multi-language UI (3 locales) and legal/compliance information on the landing page.
- Production deployment — Docker Compose on VPS, custom domain with HTTPS, env/secrets management, deploy scripts, SMS integration.
- Reliability & UX fixes — payment fulfillment race conditions, acquiring API edge cases, delivery address CRUD, and empty-state improvements.

Tech stack: Next.js 15, React, TypeScript, Tailwind CSS, NestJS 11, MongoDB, Docker, Leaflet, payment gateway REST APIs, Stripe Connect, WebSockets, Linux VPS

Debate Zone

2023 — Present

Founder / Full-Stack Developer

Debate Room — cross-platform live debate platform (iOS, Android, web) for hosting and joining audio/video debates.

- Built native iOS (SwiftUI + WebRTC) and Android (Jetpack Compose) apps with SMS and Google Sign-In, profile management, push notifications, and in-app legal views.
- Architected a Dockerized Node.js/TypeScript backend: REST API, Socket.IO + mediasoup signaling, recording worker, and AI worker — MongoDB, Redis, MinIO, nginx gateway.
- Implemented real-time debate mechanics: timed turns/rounds, live moderation, blind mode, async chat, polls, on-site debates, invites, teams, and organizations.
- Built a server-side recording pipeline: mediasoup track capture, FFmpeg merge/finalize, retryable jobs, outputs uploaded to object storage.
- Added an AI/NLP pipeline: Whisper transcription, transcript summaries, Ollama topic generation, AI room moderator, and political-preference scoring.
- Shipped a Next.js marketing site with localization, admin dashboard, OpenAPI/Swagger docs, centralized logging, Prometheus metrics, and backup/restore tooling.

Tech stack: TypeScript, Swift, Kotlin, Express, Socket.IO, mediasoup, FFmpeg, Whisper, Ollama, Docker, Twilio, Google OAuth, FCM

FeelIT

2022 — 2023

Back End Developer

Back-end development on an emotional-intelligence platform — Node.js and Express.js services with AI integrations for speech transcription and emotional analysis, plus React frontend work.

- Built and maintained Node.js / Express.js REST APIs for core product features.
- Integrated OpenAI and related AI services for speech transcription and emotional detection on the backend.
- Worked with React on frontend features and API integration.
- Maintained legacy code, fixed bugs, performed code reviews, and participated in task planning and estimation.

Tech stack: Node.js, Express.js, OpenAI, speech transcription, emotional detection, React, REST APIs

Amdaris

2021 — 2022

Back End Developer

Back-end development in a microservices environment — Java/Spring Boot and Node.js services with REST and GraphQL APIs, SQL and MongoDB data stores, plus Azure deployment on an internal project.

- Built and maintained microservices with Java, Spring Boot, and Node.js.
- Designed and implemented REST and GraphQL APIs for internal product features.
- Worked with SQL and MongoDB across service boundaries in a microservices architecture.
- Feature development, legacy maintenance, code reviews, task estimation, and Azure deployment.

Tech stack: Java, Spring Boot, Node.js, GraphQL, REST API, microservices, SQL, MongoDB, Azure

Crossinx GmbH

2018 — 2021

Back End & Android Developer

Back-end and Android development for a business web platform — Java/Spring Boot microservices on the server side and an Android client with OpenCV-based document detection, plus a Kotlin multiplatform library shared with iOS.

- Developed and maintained server-side business logic with Java, Hibernate ORM, and Oracle database.
- Refactored a monolithic backend into a microservices architecture with Java and Spring Boot.
- Built Android features in Java, including OpenCV-based document detection and scanning flows.
- Created a Kotlin multiplatform library to share core logic between Android and iOS.

Tech stack: Java, Kotlin, Spring Boot, Android, OpenCV, Hibernate, Oracle
